FARNESYL TRANSFERASE INHIBITORSBackground of the Invention

Ras is a 21,000 molecular weight protein important in the signal transduction pathway for normal cell growth. The protein is produced in the ribosome, released into the cytosol, and post-translationally modified. The first step in the series of post-translational modifications is the alkylation of Cys¹⁶⁸ with farnesyl pyrophosphate in a reaction catalyzed by the enzyme farnesyl transferase (Hancock, JF, et al., Cell 57:1167-1177 (1989)). Subsequently, the three C-terminal amino acids are cleaved (Gutierrez, L, et al., EMBO J. 8:1093-1098 (1989)), and the terminal Cys¹⁶⁸ is methyl esterified (Clark, S, et al., Proc. Nat'l Acad. Sci. (USA) 85:4643-4647 (1988)). Some forms of Ras are also reversibly palmitoylated on cysteine residues immediately N-terminal to Cys¹⁶⁸ (Buss, JE, et al., Mol. Cell. Biol. 6:116-122 (1986)). These modifications increase the hydrophobicity of the C-terminal region of Ras, causing it to localize at the surface of the cell membrane. Localization of Ras to the cell membrane is necessary for normal function (Willumsen, BM, et al., Science 310:583-586 (1984)).

Oncogenic forms of Ras are observed in a relatively large number of cancers including over 50 percent of colon cancers, over 30 percent of lung cancers, and over 90 percent of pancreatic cancers (Bos, JL, Cancer Research 49:4682-4689 (1989)). These observations suggest that intervention in the function of Ras mediated signal transduction may be useful in the treatment of cancer.

Previously, it has been shown that the C-terminal tetrapeptide of Ras has the "CAAX" motif (wherein C is cysteine, A is an aliphatic amino acid, and X is any amino acid). Tetrapeptides having this structure have

- 2 -

been shown to be inhibitors of farnesyl transferase (Reiss, et al., Cell 62:81-88 (1990)). Poor potency of these early farnesyl transferase inhibitors has prompted the search for new inhibitors with more favorable pharmacokinetic behavior (James, GL, et al., Science 260:1937-1942 (1993); Kohl, NE, et al., Proc. Nat'l Acad. Sci. (USA) 91:9141-9145 (1994); deSolms, SJ, et al., J. Med. Chem. 38:3967-3971 (1995); Nagasu, T, et al., Cancer Research 55:5310-5314 (1995); Lerner, EC, et al., J. Biol. Chem. 270:26802-26806 (1995)).

Recently, it has been shown that a farnesyl transferase inhibitor will block growth of Ras-dependent tumors in nude mice (Kohl, NE, et al., Proc. Nat'l Acad. Sci. (USA) 91:9141-9145 (1994)). In addition, it has been shown that over 70 percent of a large sampling of tumor cell lines are inhibited by farnesyl transferase inhibitors with selectivity over non-transformed epithelial cells (Sepp-Lorenzino, I, et al., Cancer Research, 55:5302-5309 (1995)).

 The dose of a compound of the present invention
20 for treating the above-mentioned diseases or disorders varies depending upon the manner of administration, the age and the body weight of the subject, and the condition of the subject to be treated, and ultimately will be decided by the attending physician or veterinarian. Such
25 an amount of the compound as determined by the attending physician or veterinarian is referred to herein as a "therapeutically effective amount."

 Also contemplated within the scope of the invention is a method of preparing the compound of
30 formula (I) or formula (II) and the novel chemical intermediates used in these syntheses as described herein.

 Other features and advantages of the present invention will be apparent from the detailed description
35 of the invention and from the claims.

15 Antiproliferative activity of farnesyl-transferase inhibitors on human tumoral cells

The assays were performed using either A-427 lung carcinomas (expressing mutated Ki-ras gene), HT-29 colon adenocarcinomas (expressing wild type ras gene), Calu-1 lung carcinomas (expressing mutated Ki-ras gene), and MIA-PaCa pancreatic cancer cells (expressing mutated Ki-ras gene). These tumoral cells were seeded on 96 well plates at day 0 and maintained at 37°C in 5% CO₂ atmosphere. At day 1, cells were treated with increased concentrations of test compounds ranging from 0 to 100 μM for 96 hrs. At the end of this period, the quantification of cell proliferation was evaluated by the colorimetric assay based on the cleavage of the tetrazolium salt WST-1 by mitochondrial dehydrogenases in viable cells leading to the formazan formation (Cell Proliferation Reagent WST-1 Kit, Boehringer Mannheim, Germany). These experiments, done in octuplicate, were repeated twice. The results, shown in Table I, depict the concentration range (μM) of test compound required to

- 62 -

inhibit proliferation as compared to control cells in which no test compound was added.
